

A B S T R A C T

A lid apparatus for opening/closing an opening (12) of a main body (8) includes a lid (14) with working and back faces. An arm (24) attaches the lid (14) to the main body (8) to be operable for opening/closing. The arm (24) includes a first axis (26) pivotally supporting the arm (24) on the main body (8) around the opening (12), and a second axis (34) swingably supporting the back face of the lid (14) on the arm (24). The second axis (34) is between the gravity center (C1) of the lid (14) and the first axis (26). A regulatory member (50) intervenes between the arm (24) and the back face of the lid (14), and regulates the distance therebetween, at a regulatory position between the first and second axes (26, 34), to set the working face of the lid (14) in parallel with the opening (12).
